

Publish User Cubes - Systems Flow (overview_n1)
Subject Area: N1
Run Cycle: Daily (every calendar day)
Calendar: **Group:**
Created by: Alex Booth
Last Updated:- **22Oct01** **By: Alex Booth**

- 1) The dynamically built proc is generated on UNIX. An SQL selects the User cube publish parameters from a system table and constructs an NT procedure.
- 2) The procedure is copied into the NT PROCLIB library.
- 3) The dynamic procedure is then executed (CALLED) from an NT job

The system parameter table is nw.nw_sys_cube_publish_parms

NOTE There is one set of jobs for each publish frequency.
The **nn** in the job and dynamic proc name is different for each job stream.
Currently there are two streams-
01 - CYCLIC publish frequency
02 - ONE-OFF publish frequency
