

The diagram illustrates the data integration process for 11 different data feeds from NT - Advantra to UNIX - NWPROD01. Each feed follows a similar workflow:

- Data Source:** A data file (e.g., `z8_cacs_nz_trans_qty_01.dat`) is received via FTP (e.g., `nwz8ft30`).
- Check File:** The data is processed by a check file (e.g., `nwz8cf30`) to verify integrity.
- Sort File:** The data is then sorted using a sort file (e.g., `nwz8so30`).
- Target Table:** The sorted data is loaded into a target table (e.g., `nwz8so10`) using a flow28cacs utility.

The feeds and their corresponding target tables are:

- `z8_cacs_nz_trans_qty_01.dat` → `nwz8so10`
- `z8_cacs_nz_trans_chgamt_01.dat` → `nwz8so11`
- `z8_cacs_nz_trans_numcalls_01.dat` → `nwz8so12`
- `z8_cacs_nz_servprov_01.dat` → `nwz8so13`
- `z8_cacs_nz_country_01.dat` → `nwz8so14`
- `z8_cacs_nz_chargetype_01.dat` → `nwz8so15`
- `z8_cacs_nz_project_01.dat` → `nwz8so16`
- `z8_cacs_nz_midrange_01.dat` → `nwz8so17`
- `z8_cacs_nz_mainframe_01.dat` → `nwz8so18`
- `z8_cacs_nz_mac_01.dat` → `nwz8so19`
- `z8_cacs_nz_appn_01.dat` → `nwz8so20`

A database icon for `nw_sys_prodate (Oracle Table)` is also shown, indicating its role in the data integration process.
