NWCOGNOSUP and **NWCOGNOSDN** control the availability of the 'COGNOS' quantitative resource on CTMPROD and NWPROD01. This ensures that any batch job that relies on the COGNOS online environment to be available will not run whilst the backup stream is running.

The "shadowed" jobs are Control_M dummy jobs and do not have a job deck. They are "marker" jobs which act as placeholders in the processing flow. The individual server backup processes will hook to these marker jobs.

The "*marker*" job names are named -

C - Component

COGNOS All components

GATEWAY Gateways

DSPTCH Dispatcher

QUERY Query servers

P - Purpose

DN Shutdown begin

SP Stopped

ST Starting

UP Up & available

The non "marker" jobs represent the processes (jobs) that will run on the individual servers.
