

NT Server Back Ups - Job Flow (opcn002d)
Subject Area: N0
Run Cycle: Daily (every calendar day)
Calendar: Group: NWN0D
Created by: Alex Booth
Last Updated:- 29Dec06 By: Haydn Lee

Each of the individual COGNOS NT servers will have run it's own backup process which ZIPs up all the critical files into a ZIP file that is located on **G:** the file server..

g:\data_a\nwprodnn\backups_ftp
and is referenced by
\\nwprodfs.gdw.srv.westpac.com.au\s_fs01\nwprodnn\backups_FTP

The jobs in this flow then sweep up all these backup files that are on each NT COGNOS server onto the HP host.

The backups FTPed from each server are then combined into a single file using the TAR utility and then FTPed to a GDG file on the MVS host.

This job is run manually by GDW support to recover COGNOS NT Server backups onto the HP platform.

They are then accessed using WINZIP from any PC.

Instructions for it's use are in the job itself
